IDENTIFIERS	National Assessment of Educational Progress; National Center for Education Statistics; *National High School Transcript Study (NCES)

ABSTRACT

The 1994 High School Transcript Study (HSTS) provides the Department of Education and other policymakers with information about current course offerings and students' course-taking patterns in the nation's secondary schools. One objective was to determine changes in course offering and selection patterns since the previous studies in 1982, 1987, and 1990. Another objective was to compare course-taking patterns to results from the National Assessment of Educational Progress (NAEP), an assessment of educational achievement nationwide. In 1994, transcripts were collected for more than 25,000 students who graduated from high school that year. These students were from 340 schools that participated in the NAEP. Information in this report documents a significant increase since 1982 in the percentage of graduates completing curricula recommended by the National Commission on Excellence in Education. As of 1994, over 25% of high school graduates are completing programs satisfying the Commission's recommendations for college-bound graduates, and nearly one-third are completing the Commission's core curriculum. Chapters 1, 2, and 3 of this report contain highlights of the study results, descriptions of the studies from 1982 through 1994, an introduction to the tables of data, a brief description of subject taxonomy, a discussion of the comparability of samples in the studies, and directions for testing the significance of differences reported in the tables. Appendix A contains tables of study data, and Appendix B lists study codes for each category of data. (Contains 121 tables.) (SLD)

The National Center for Education Statistics (NCES) is the primary federal entity for collecting, analyzing, and reporting data related to education in the United States and other nations. It fulfills a congressional mandate to collect, collate, analyze, and report full and complete statistics on the condition of education in the United States; conduct and publish reports and specialized analyses of the meaning and significance of such statistics; assist state and local education agencies in improving their statistical systems; and review and report on education activities in foreign countries.

NCES activities are designed to address high priority education data needs; provide consistent, reliable, complete, and accurate indicators of education status and trends; and report timely, useful, and high quality data to the U.S. Department of Education, the Congress, the states, other education policymakers, practitioners, data users, and the general public.

We strive to make our products available in a variety of formats and in language that is appropriate to a variety of audiences. You, as our customer, are the best judge of our success in communicating information effectively. If you have any comments or suggestions about this or any other NCES product or report, we would like to hear from you. Please direct your comments to:

B-1	Organization of the Secondary School Taxonomy	B-3

1. INTRODUCTION TO THE TABULATION OF TRANSCRIPT DATA FOR THE 1994 HIGH SCHOOL TRANSCRIPT STUDY

The 1994 High School Transcript Study (HSTS) was conducted by Westat, Inc. for the U.S. Department of Education's National Center for Education Statistics (NCES). Approximately 25,000 transcripts of students who graduated in 1994 were collected from a nationally representative sample of 340 schools. This study provides the Department of Education and other educational policymakers with information regarding current course offerings and course-taking patterns in the Nation's secondary schools. In addition, it provides information on the relationship of student course-taking patterns to achievement as measured by the National Assessment of Educational Progress (NAEP), a federally-funded, ongoing, periodic assessment of educational achievement in the Nation's schools.

Since similar studies were conducted of the course-taking patterns of 1982, 1987, and 1990 graduates, changes in these patterns can be studied and compared. In particular, the data from this study permit analysts to investigate the impact of the "New Basics" or "Core Curriculum" introduced in the 1980s.[1] The 1982 data are based on approximately 10,000 transcripts collected by the High School and Beyond study (HS&B). The 1987 data are based on approximately 23,000 transcripts obtained as part of the 1987 High School Transcript Study. The 1990 data are based on approximately 21,000 transcripts obtained as part of the 1990 High School Transcript Study. All four studies coded the courses taken by students using the *Classification of Secondary School Courses* (CSSC), a database of course codes.[2]

Chapters 1, 2, and 3 of this report contain the following major sections:

- Highlights of the study results;
- Descriptions of the 1994, 1990, 1987, and 1982 studies;

---

[1] Note that in 1987 the term "New Basics" was used where "Core Curriculum" is used in this study.

[2] M.J. Ludwig, L. Olivetti, N. Sandberg, and B. Waite, *A Classification of Secondary School Courses*, Alexandria, VA: Evaluation Technologies Incorporated, July 1982.

- An introduction to the tables including:
    - An overview of the major types of tables in the report;
    - Definitions of the variables used in the tables;
    - Table-specific notes;
- A brief description of the subject area taxonomy;
- A discussion of the comparability of the samples in the four studies; and
- Directions for testing the significance of differences reported in the tables.

The data tables for the 1994 HSTS are presented in Appendix A. Appendix B contains a listing of the categories (stubs) used as row labels in the tables and the CSSC codes associated with each category.

1.1 Highlights of the Results

In 1983, the National Commission on Excellence in Education in *A Nation at Risk* recommended that all students complete a core curriculum in high school that includes at a minimum 4 years of English, 3 years of Social Studies, 3 years of Science, 3 years of Mathematics, and one-half year of computer-related courses (including computer applications as well as programming courses). The Commission also recommended that college-bound students also complete 2 years of Foreign Language courses. Since that time, most states have increased their high school graduation requirements substantially. While no state had mandated the full set of the Commission's recommendations by the time the students analyzed in this report had graduated, most states had mandated requirements in the four core subjects of English, Social Studies, Science, and Mathematics. Most states require at least 4 years of English and 3 of Social Studies. By 1994, three states had added 3 years of Science and 3 years of Mathematics to these requirements and 22 additional states had added at least 2 years of Science and 2 years of Mathematics. Some of the latter states require a combination of 5 years in Science and Mathematics.[3]

---

[3] See the discussion of Tables 18 through 20 in Chapter 3 for sources of information on state laws.

For ease of exposition, we use "Law 1" to refer to course-taking patterns equivalent to an academic program including 4 years of English, 3 years of Social Studies, 3 years of Science, and 3 years of Mathematics. We use "Law 2" to refer to course-taking patterns equivalent to an academic program including 4 years of English, 3 years of Social Studies, 2 years of Science, and 2 years of Mathematics.

The tables in Appendix A document significant, across-the-board increases since 1982 in the percentage of graduates completing curricula recommended by the Commission. These include large increases since 1990 in the percentage of graduates completing both the all-student and the college-bound student curricula recommended by the Commission. As of the class of 1994, over 25 percent of high school graduates are completing programs satisfying the recommendations for college-bound students and nearly one-third of high school graduates are completing the core program recommended by the Commission. There is also a sharp increase in the percentage of students completing programs that satisfy the Law 1 requirements (almost 50 percent of the graduates) and of the percentage of graduates completing the programs satisfying the Law 2 requirements (now close to three-fourths of the graduates) (see Tables 11 and 21).[4]

More stringent graduation requirements appear to be related to completion of more demanding curricula among graduates. For example, 84 percent of graduates in states requiring the Law 2 curriculum met the Law 2 requirement compared to 63 percent of students in all other states. Similarly, over 80 percent of students in states requiring the Law 1 curriculum satisfied that requirement while less than half the students in the remaining states did so (see Table 18).[5]

Other key findings include the following:

- Both males and females showed significant increases over their counterparts in the class of 1990 in the percentage graduating after completing the core curriculum. Similarly, significant gains were made by both genders in the percentage completing a college-bound curriculum (the core curriculum plus 2 years of a foreign language) and in the percentage completing Law 1 and Law 2 programs (Table 12).

---

[4] In this section, statements regarding comparisons of the entire population in 1994 to the population in 1982, 1987, or 1990 are based on t-tests with 25 degrees of freedom at a probability of $p \leq 0.05$ ($t \geq 2.060$).

[5] There are a number of reasons why students may legitimately receive diplomas that do not satisfy the requirements included in state laws, including (1) the student started school more than 4 years before he or she graduated and was subject to a less stringent set of graduation requirements, (2) the student may have received a diploma with a special education endorsement or a certificate of attendance that was not reflected as such on the documents provided to us, or (3) the transcript may include only 3 years of data rather than 4.

- From 1990 to 1994, there were significant increases among whites, Hispanics, and Asian/Pacific Islanders in the completion of college bound and core curriculum programs. Hispanics, whites, and Native Americans had significant increases in the completion of Law 2 programs. This trend reflects a general leveling of the percentage of students completing these programs compared to the distribution of ethnic groups in previous years. The percentage of students completing the Law 2 requirements in 1994 ranges from 73.1 percent for Asian/Pacific Islanders to 77.5 percent for Hispanics. (Table 13)

- From 1990 to 1994, there were significant increases in the completion of both college bound and core curriculum programs in urban fringe areas and small places, but not in medium sized cities and big cities (Table 15).

- From 1990 to 1994, there were significant increases in the completion of all types of curriculums ranging from college bound to Law 2 in public schools. The percentage of graduates from nonpublic schools with diplomas meeting the Law 1 standard is still about 14 points greater than that in public schools (Table 16).

- There were significant increases in the percentage of students completing Law 1 programs in the Northeast, Midwest, and West, while the South retained relatively high completion rates. (Table 17).

- In 1994, the percentage of students completing at least the Law 1 program in states requiring that curriculum was approximately 70 percent greater than in all other states. Similarly, the percentage of students completing the slightly weaker Law 2 curriculum was approximately one-third greater in Law 2 states than in all other states (Table 18).

- The distributions of NAEP proficiencies are quite similar for the HSTS subsample of 1994 graduates and the overall NAEP sample of 12th-graders (Tables 103 through 105).

- A student's performance on all three NAEP assessments is strongly associated with his or her academic program, defined in terms of course-taking patterns. For example, students in Academic programs score approximately 13 percent higher on the NAEP Reading Assessment than students in Vocational programs (Table 105). Similarly, there is a high correlation ($r = 0.38$, $SE = 0.01$) between the number of Science courses that a student completes and his or her NAEP Reading proficiency (Table 22).

- When course-taking patterns are viewed from the perspective of the Core Curriculum categories, the same picture emerges. For all five of the course-taking patterns displayed in Table 108 (History), Table 113 (Geography), and Table 118 (Reading), students who meet the criteria perform significantly better on NAEP assessments than students who do not. For example, students meeting the Law 2 requirements of 4 years of English, 3 of Social Studies, 2 of Science, and 2 of

Mathematics score 17 points higher (6 percent) on NAEP Reading tests than students who do not meet these criteria ($t = 9.36$, $p < 0.05$, $df = 25$).

- The data provide evidence that high performance in one area tends to be related to high performance in general.

  - There are moderately sized positive correlations between the number of Social Studies credits completed by students and their proficiencies in Geography ($r = 0.15$, $SE = 0.02$) and History ($r = 0.19$, $SE = 0.02$). There is a similar correlation between the number of Social Studies credits completed and their Reading proficiencies ($r = 0.12$, $SE = 0.02$). (Table 22).

  - There are substantially larger correlations between the number of Mathematics and Science courses completed and Geography, History, and Reading proficiency. These range from $r = 0.34$ ($SE = 0.01$) for the correlation between number of Mathematics courses completed and Reading proficiency to $r = 0.46$ ($SE = 0.02$) for the correlation between number of Science courses completed and Geography proficiency (Table 22).

  - There are also large correlations (ranging from 0.38 to 0.41 with SEs from 0.02 to 0.03) between the number of Foreign Language courses completed and proficiency in Geography, History, and Reading (Table 22).

  - Not surprisingly, grade point average (GPA) is very strongly associated with performance on each of the NAEP assessments. The correlations between GPA and NAEP Geography, History, and Reading proficiencies are 0.49 ($SE = 0.02$), 0.50 ($SE = 0.02$), and 0.55 ($SE = 0.01$), respectively (Table 23).

Rather than claim that earning a large number of credits in Mathematics or Science will lead to increased performance in Geography, History, and Reading, it seems more likely that those students who are high performers in Mathematics are also high performers in other areas because of such factors as family background, variations in school quality, peer influence, tracking in course assignments, and academic interest. Many of these factors will also be associated with students taking additional courses in academic subjects.

There is, of course, a clear relationship between earning credits in specific subject areas and demonstrating proficiency in those areas. Thus, the positive correlations between the number of Social Studies credits earned and proficiency in Geography and History is reflected in the monotonic relationship between the number of credits earned in Social Studies and the NAEP proficiency scores in Geography and History (Tables 106 and 111).

- The lack of sizable correlations between the number of credits completed in computer-related courses and NAEP proficiencies is a reflection of the fact that the computer-related studies category includes courses ranging from computer science and programming courses to such nonacademic courses as keyboarding.

- The number of General Labor Market Preparation credits earned is negatively correlated with Geography (r = - 0.23, SE = 0.02), History (r = - 0.21, SE = 0.02), and Reading (r = - 0.15, SE = 0.02). Similarly, the number of Specific Labor Market Preparation credits earned is negatively correlated with Geography (r = - 0.27, SE = 0.02), History (r = - 0.28, SE = 0.02), and Reading (r = - 0.26, SE = 0.02) (Table 22).

1.2 An Overview of the Four Transcript Studies

Westat conducted the 1987, 1990, and 1994 High School Transcript studies for NCES using nearly identical methodologies and techniques. The 1982 study was conducted as part of the High School and Beyond Study. A brief description of each study follows. For a full description, see the technical report for each of the studies.[6]

For each of the studies, Westat estimated sampling errors by an application of the jackknife procedure. The standard procedure used by Westat is to attach a set of replicate weights (21 for 1982, 36 for 1987, 56 for 1990, and 62 for 1994) to each record, one for each replicate. Variance estimation is then performed by repeating the estimation procedure once using the original full set of sample weights, and once for each set of replicate weights. Using this procedure, the variance estimation calculations were performed 22 times for the 1982 data, 37 times for the 1987 data, 57 times for the 1990 data, and 63 times for the 1994 data. The variability among replicate estimates is then used to derive an approximately unbiased estimate of sampling variance. The number of replicates was increased from 36 for the 1986 NAEP assessment to 56 for the 1990 NAEP assessment, and 62 for the 1994 NAEP assessment to give more precise estimates of sampling variance. That is, the procedure provided more degrees of freedom for standard error estimates. The procedure was used to obtain sampling errors for a large number of variables for the whole population and for specified subgroups. See Chapter 6 of the *1994 High School Transcript Study Technical Report* for a detailed description of the jackknife procedure.

---

[6] S. Legum, et al., *1994 High School Transcript Study Technical Report*, National Center for Education Statistics, U.S. Department of Education, NCES 97-xxx, forthcoming. S. Legum, et al., *1990 High School Transcript Study Technical Report*, National Center for Education Statistics, U.S. Department of Education, NCES 93-117, June 1993. J. Thorne, et al., *1987 High School Transcript Study Technical Report*, Rockville, MD; Westat, Inc., February 1989. C. Jones, et al., *High School and Beyond First Follow-up (1982)*. Technical Report. Chicago, IL: National Opinion Research Center, 1983. C. Jones, et al., *High School and Beyond Transcript Survey (1982). Data Files User's Manual Contractor Report*, Chicago, IL: National Opinion Research Center, 1983.

The 1982 High School and Beyond study used a different method for identifying students with disabilities than did the 1987, 1990, and 1994 transcript studies. Therefore, in order to make the statistical summaries as comparable as possible, the counts and percentages in this report are restricted to students whose records indicated that they received regular or honors diplomas but not Special Education diplomas or Certificates of Attendance.[7]

1.2.1 The 1994 High School Transcript Study

Between May and November 1994, Westat collected high school transcripts from 25,575 students who graduated from high school in 1994.[8] So that the tables represent students with complete transcripts, we excluded students whose transcripts did not include course-by-course data for at least 3 full years of high school. To be consistent with other published analyses, we included only students with regular diplomas or honors diplomas and excluded students with Special Education diplomas or Certificates of Attendance. We also excluded students whose transcripts show no English credits or less than 16 total credits. These restrictions reduced the number of 1994 graduates represented in the tables to 24,844. These students attended 340 schools that had previously been sampled for the National Assessment of Educational Progress.

The sample of schools was nationally representative of schools teaching grade 12 or having 17-year-old students (380 schools were selected for the sample; 1 of these had no 12th-grade students). The sample of students was representative of graduating seniors from each school. Approximately 90 percent of the sampled students had participated in NAEP assessments in 1994. The remaining students attended schools that did not participate in NAEP or that did not retain the lists linking student names to NAEP identification numbers.

---

[7] Previous transcript study reports have excluded all students identified by their schools as disabled. In order to be consistent with other recent NCES publications, this report includes such students unless they received special education diplomas or certificates of attendance. This change has the largest impact on the 1987 data, which intentionally oversampled students with disabilities. In 1990 and 1994, students were classified as "disabled" when the school provided us with a special form identifying them as having an Individualized Education Program (IEP). In 1994, students were also classified as disabled if they received a special education diploma or certificate of attendance. There are 1,120 students with the disability flag set among the 1994 graduates. There are 142 students who received certificates of attendance and 95 who received special education diplomas. The tables include 765 graduates with disabilities.

[8] A total of 28,715 transcripts were requested. Of these, 1,031 students were still enrolled, 408 were dropouts, 1,157 had transferred or received GEDs, and 127 were out of scope (either foreign exchange students or pre-1994 graduates). The schools could not find records for 417 students.

Since the focus of the transcript study is on high school graduates, schools with 17-year-olds but without a 12th grade are not included. In addition, only those students who graduated from high school in 1994 are included. Thus, students who graduated prior to 1994 and were taking "post graduate" courses are excluded, as are 12th-grade students who failed to graduate in 1994.

Each course appearing on a student's transcript was assigned a six-digit code based on the course content and level.[9] For example, an on-grade-level, 10th-grade English course receives a particular numerical code and is distinguished from a remedial 10th-grade English course. Course catalogs and other materials and information from the participating schools were used to determine the content and level of courses at each school. The coding system employed was the *Classification of Secondary School Courses*, containing approximately 2,200 course codes, adapted as necessary to distinguish levels of courses and to expand the special education course codes. Additional information coded for each course included grade and credit received. Student information included sex, grade level, age, graduation status, and race/ethnicity.

Student transcript data were weighted for the purpose of making estimates of course-taking by high school graduates nationwide The final weight attached to an individual student record reflected two major aspects of the sample design and the population being surveyed. The first component, the base weight, was used to expand sample results to represent the total population and reflected the probability of selection in the sample (the product of the probability of selection of the primary sampling unit, and the school and student within the primary sampling unit). The second component resulted from the adjustment of the base weight to account for nonresponse within the sample and to ensure that the resulting survey estimates of certain characteristics (race/ethnicity, size of community, and region) conformed to those known reliably from external sources.

1.2.2 The 1990 High School Transcript Study

In the spring of 1991, Westat collected high school transcripts from 21,607 students who graduated from high school in 1990 (23,270 were requested). Of these, 21,075 received regular or honors diplomas, had at least some English credits and had at least 16 total credits. These students are included in the tables in Appendix A. They attended 330 schools that had previously been sampled for NAEP. The sample of schools was nationally representative of schools teaching grade 12 or having 17-year-old students (379 schools were selected for the sample; 8 of these had no 12th-grade students). The sample of students was representative of graduating seniors from each school. Approximately three-fourths of the sampled students had participated in NAEP assessments in 1990. The remaining students attended schools that did not participate in NAEP or did not retain the lists linking student names to NAEP IDs.

---

[9] The codes used in the 1987, 1990, and 1994 High School Transcript Studies actually consisted of seven digits, but only the first six were used for the tables presented here. Only courses actually taken in grades 9 through 12 are included. Some 7th- and 8th-grade courses are included, however, because they were taken for high school credit in grades 9 through 12. Some of these courses are Spanish 7 and 8 (CSSC codes 160931 and 160932), Industrial Arts 7 and 8 (210101 and 210102), and Chorus 8, Advanced (500938).

As with the 1994 HSTS, schools with 17-year-olds but without a 12th grade were not included, and only students who graduated from high school in 1990 were included.

1.2.3 The 1987 High School Transcript Study

The schools selected for the 1987 High School Transcript Study consisted of a nationally representative sample of 497 secondary schools selected for the 1986 NAEP for grade 11/age 17 students. Of the total number of schools selected, 433 participated. Four of these schools had no eligible students without disabilities. The 1987 study was restricted to graduates who were in grade 11 in 1985 and 1986. There are 24,622 graduates from 1987 represented in these tables. Note that, although the 1987 study oversampled students with disabilities, the same inclusion and exclusion criteria were applied to the 1987 data as to the other years' data so that the data should be comparable.

1.2.4 High School and Beyond

In 1982, high school transcripts were collected for members of the High School and Beyond (HS&B) study's sophomore cohort who were selected to be in the second followup survey. For purposes of this report, we selected students who had graduated from high school, received a regular or honors diploma, and had positive weights. In addition, these students needed to have some English credits and at least 16 total credits. This provided us with 12,413 transcripts. The HS&B was conducted for NCES by the National Opinion Research Center (NORC).

As in the 1987, 1990, and 1994 High School Transcript Studies, records were obtained from all types of high schools, public and private. Information from the transcripts, including specific courses taken, and grades and credits earned, was coded according to the CSSC coding system and processed into a system of data files designed to be merged with HS&B questionnaire and test data files. Unlike the High School Transcript Studies, however, some information was not coded. Uncoded information included the identification of courses as remedial, regular, or advanced, as offered in a different location, or as designed for students with disabilities.

Using information available on the Restricted Use Data File for the first followup study that is maintained by NCES, Westat constructed 21 replicates for variance estimation in a manner similar to that used for the 1987, 1990, and 1994 studies and used these to calculate estimates of sampling error in a manner similar to that described above. The weights used for estimation were obtained directly from the High School and Beyond Public Use Data File.

2. INTRODUCTION TO THE TABLES

As noted earlier, the data tables for the 1994 HSTS appear in Appendix A of this report. The purpose of the tables is to provide a detailed description of the course-taking patterns of high school graduates in 1994 and to provide a means for determining what changes have taken place in these patterns since 1982. The tables also indicate the relationship between course-taking patterns and student achievement in Reading, Geography, and History.

Approximately 2,200 CSSC course codes were classified into various subject matter areas such as English, Mathematics, and History. This classification into subject areas is hierarchical. For example, the Mathematics category contains a number of subcategories including Geometry and Calculus. The full hierarchy and the six-digit CSSC codes associated with each subject matter grouping are shown in Appendix B.

2.1 Types of Tables

There are nine general types of tables presented in Appendix A:

- Tables displaying the distribution of graduates by student program (academic or vocational), school type (public/nonpublic), and demographic categories (gender, race/ethnicity, community type, and region) -- Tables 1 to 7.
- Tables displaying the mean number of credits in a subject earned by particular subgroups of students -- Tables 8 to 10, 26, and 32 to 39.
- Tables displaying the percentage of graduates earning the indicated minimum number of credits in the core curriculum courses in 1982, 1987, 1990, and 1994 -- Tables 11 to 20.
- A table (Table 21) displaying the change in the percentage of graduates earning the indicated minimum number of credits in the core curriculum courses between 1982 and 1994, between 1987 and 1994, and between 1990 and 1994.
- Tables displaying correlations of NAEP proficiencies with various measures -- Tables 22 to 25.

- Tables displaying the percentage of graduates earning various number of credits in specific subject fields -- Tables 27 to 31.
- Tables displaying the percentage of students in subgroups who took at least a specified minimum number of credits in a subject -- Tables 40 to 102.
- Tables displaying NAEP proficiencies by GPA, credits earned, student program, school type, and demographic categories -- Tables 103 to 120.
- A table displaying the number of 1994, 1990, 1987, and 1992 students receiving credit in each secondary subject -- Table 121.

The tables in Appendix A present a great variety of information. Many display data from all four studies. Most tables that display estimates from multiple years also contain the standard error of each estimate so that hypothesis tests can be performed. Unweighted frequencies and percentages in Tables 1 through 7 do not have standard errors because they do not reflect national totals. Tables 1 to 7 describe demographic characteristics of the samples and are not directly related to course-taking patterns. For reasons of compactness, no standard errors have been included in Table 121. Since much of the data in this table is highly disaggregated, it should be used for exploratory purposes only. All remaining estimates are accompanied by standard errors.

All estimates in the tables are weighted with the exception of some in Tables 1 through 6. Tables 1 through 5 display both unweighted and weighted statistics for the classification variables. Table 6 displays an unweighted cross-classification of the other classification variables by type of student program. Table 7 displays the weighted versions of the variables in Table 6.

2.2 "Not Reported" Values for Demographic Variables

The 1987, 1990, and 1994 data contain a number of cases in which either the students' gender or the race/ethnicity are not available. These cases are listed as "Not Reported" in Tables 1, 2, and 3. The 1982 data contain no such cases. The 1982 study was able to reduce the number of such cases because, as a longitudinal study, there were more opportunities to obtain demographic information than in a cross-sectional study. In addition, the 1982 data files provided to Westat contained imputed values for any remaining unknown gender or race/ethnicity values.

The sample sizes for the "Gender Not Reported" category are small (see Tables 1, 2, and 3) for all of the studies. There are 40 such students in 1994, 9 in 1990, and 56 in 1987. This small sample size means that estimates for students of unknown gender and the related standard errors are extremely unreliable. A similar pattern occurs for the Race/Ethnicity "Other" category. The number of graduates in this category ranges from 45 to 55 in 1982, 1987, and 1990. In 1994, there are 77 graduates in the "Other" Race/Ethnicity category. For this reason, with the exception of Tables 1, 2, 3, and 4 estimates and standard error estimates for these groups of students have been omitted throughout this report. Note that these groups are exceptionally small. All other subgroups presented in the tables have sample sizes of at least 128, so that this problem is unique to the "Gender Not Reported" categories.

2.3 Definitions of the Variables Used in the Tables

The following variables, which appear in the tabulations, are defined below: Student Program, Credit, Grade Point Average, Community Type, and Census Region.

2.3.1 Student Program

For the purpose of these tables, the student classification variable "Student Program," was defined as follows:

Academic = The student has earned at least 12 credits in the following core course areas: English, Social Studies, Mathematics and/or Science *and* has less than 3 credits in any specific labor market preparation field.

Vocational = The student has earned at least 3 credits in a single specific labor market preparation field but has less than 12 credits in the academic fields of English, Social Studies, Mathematics, and Science.

Both = The student has earned at least 12 credits in English, Social Studies, Mathematics and/or Science *and* has earned at least 3 credits in a specific labor market preparation field.

Neither = The student has not met the course credit requirements above for *either* the academic or the vocational track.

2.3.2 Credit

For the 1987, 1990, and 1994 High School Transcript Studies, we recorded the number of credits received by a student for each course. Because this information varied widely, we standardized the credits across schools such that one credit is approximately equal to one Carnegie unit. That is, one credit is equal to a single class period (45 to 60 minutes in length) once per day for a complete academic year. For the 1982 graduates, we used the credits for each course as provided on the 1982 High School and Beyond data file.

In some schools, certain courses are classified as noncredit -- that is, students may complete the course with a passing grade but no credit is earned. In that case, the data file contains 0.0 credit for that course and the course is not counted for the current tables. This situation occurs most frequently in courses such as Physical Education, Religion, and other courses not considered part of the core curriculum.

2.3.3 Grade Point Average

Grade information on transcripts varied even more widely than credit information. Grades were reported as letters, numbers, or other symbols on a variety of scales. We converted numeric grades to standardized grades as shown in the following table unless the school documents specified other letter grade equivalents for numeric grades.

Numeric grade conversion

Numeric grade	Standard grade
90-100	4 = A
80-89	3 = B
70-79	2 = C
60-69	1 = D
< 60	0 = F

A student's grade point average was calculated by summing the product of the standard grade and the credits for each course attempted and dividing the total by the sum of the credits. Noncredit courses were not included in this calculation.

2.3.4 Community Type

The categories of Community Type that are available for the 1982 data are not identical to those used in 1987, 1990, and 1994, nor could they be collapsed to form comparable groupings. We have, therefore, limited the comparisons by community type to the 1987, 1990, and 1994 data.

The four categories of Community Type for the 1987, 1990, and 1994 tables are the following:

BIG CITY
URBAN FRINGE
MEDIUM CITY
SMALL PLACE

The three categories of Community Type for the 1982 tables are the following:

URBAN
SUBURBAN
RURAL

The definitions of the Community Type categories in the following table were used in 1987, 1990, and 1994. They correspond to those used by NAEP in Years 1984 and 1985.

Description of Community Code	Class	Limits
1	Big City	Within the city limits of a city with population greater than or equal to 200,000 [or within the city limits of one of two or more central cities of an urbanized area with **combined** population greater than or equal to 200,000].
2	Urban Fringe	Outside the city limits but within the urbanized area of a Big City.
3	Medium City	Within the city limits of a place with a total population greater than or equal to 25,000 but less than 200,000; the place must **not** be in the urbanized area of a Big City.
4	Small Place	Open country or a place with a total population less than 25,000; the place must **not** be in the urbanized area of a Big City.

The 1987 and 1990 designations were based on 1980 census data. The 1994 designations were based on 1990 census data.[9]

2.3.5 Census Region

The regions described in the tables in Appendix A represent the four major census regions: Northeast, South, Midwest, and West. The table below shows this division according to the states included in each region.

Census Region	States
Northeast	Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont (9 states).
South	Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia (17 states).
Midwest	Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin (12 states).
West	Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming (13 states).

---

[9] See *1990 National Assessment of Educational Progress: Sampling Weights and Procedures* and *1994 National Assessment of Educational Progress: Sampling and Weighting Procedures* for a detailed description of how these codes are assigned to each school.

2.4 The Subject Area Taxonomy

With over 2,000 codes in the CSSC, it is neither practical nor desirable to include estimates of each possible code in each of the tables. Although we provide estimates for each of the codes that appear in the transcripts in the final table in Appendix A, for most purposes it is more useful to analyze the courses in larger groups such as English, Social Studies, Math, or Science. We are, of course, also interested in finer divisions of these groups such as Biology, Chemistry, and Physics. The subject area taxonomy that is presented in Appendix B provides the structure for grouping the courses.

The Secondary School Taxonomy (SST) is used in this report.[10] This is a change from previous High School Transcript Studies, which used a taxonomy developed for the 1987 HSTS. The SST was selected for the 1994 HSTS because it is used by a number of other NCES projects including the Condition of Education 1995 and the Digest of Education Statistics 1995. All 1982, 1987, and 1990 data included in this report have been reanalyzed using the SST so that comparisons among the years can be made.

There is one major difference between the SST and the HSTS taxonomies. The SST taxonomy divides all courses into three broad domains: Academic, Vocational, and Personal/Other. There is no such division in the HSTS taxonomy.

The three domains are summarized in Tables 8, 9, and 10. The definition of the categories at the highest level of the Academic domain (Mathematics, Science, English, Social Studies, Fine Arts, Foreign Languages) is basically the same as that for the corresponding HSTS categories. We have, however, added one supplementary category to the Academic domain, Computer-related Studies, to correspond to one used in previous transcript studies. This new category has three subcategories: Clerical and Data Entry, Computer Applications, and Computer Science. A number of these courses also appear in some other academic categories (principally math) or in some of the Specific Labor Market Preparation vocational categories. When we determine whether or not a student has completed the most stringent of the "New Basics" requirements, we consider only the courses in the Computer Science category as meeting the half year of Computer Science requirement (see Tables

---

[10] Gifford, A.G., Hoachlander, E.G., and Tuma, J.E., *The Secondary School Taxonomy Final Report*, a report prepared for the National Assessment of Vocational Education, Office of Planning, Budget, and Evaluation, U.S. Department of Education (Berkeley: MPR Associates, Inc., 1995).

11 to 21). A course is, however, never double counted when reporting total credits or total academic credits. Other changes to the SST are described in Appendix B.

2.5 Comparability of the Samples

The samples for the four studies are roughly comparable. The weighting techniques used across all four studies are also comparable. However, there are some differences that warrant notice when using these tables.

The 1982 sample was drawn as part of the first followup to the High School and Beyond longitudinal study. The 1987, 1990, and 1994 studies were drawn as part of the corresponding NAEP samples. One result of this difference is that the 1982 study, because of its longitudinal nature, had more opportunity to obtain demographic information. On the other hand, because students repeated years, transferred to different schools, or dropped out of school before their senior year, there was also a greater probability that final transcripts showing 4 years of high school could not be obtained for these students.

The samples were drawn at different points in the students' high school careers. The 1982 students were sampled when they were sophomores and were followed when they transferred to new schools. The 1987 students were sampled when they were juniors, but no attempt was made to follow them if they left school. The 1990 and 1994 students were sampled in their senior year. Thus the 1987 study sample, unlike the others, has no students who transferred into their school during their senior year.

All four samples used a multistage, stratified, and clustered design. There are differential rates of oversampling among the studies to reflect special interests. For instance, the 1982 study included nonsampled co-twins, and the 1987 study oversampled students with disabilities.

Westat performed all the variance estimation using the jackknife procedure. Because the number of replicates used in the 1990 study was greater than in the earlier studies, the variance estimates for 1990 are somewhat more precise than in the earlier studies. Similarly, because the number of replicates used in the 1994 study was greater than in the earlier studies, the variance estimates for 1994 are even more precise.

Note that the 1982 sample differed from the others in both the numbers of schools and the numbers of transcripts in the sample. In 1982 there were considerably fewer transcripts than in later years. The number of schools involved, however, was considerably greater. This means that comparable estimates tend to have comparable sampling errors across years, despite the differences in the number of transcripts sampled. In fact, the sampling errors are often smaller for 1982 estimates. In other words, the design effects for years other than 1982 were considerably greater than for 1982, more than offsetting the effects of the larger sample size of transcripts for those other years.

The sample sizes differ in the four studies and are summarized in the table below.

Sample size	1994	1990	1987	1982
Schools in the original sample	379	379	497	1,882
Schools represented in the tables	340	330	429	947
Students in the original sample	28,715	23,270	35,180	18,427
Transcripts represented in the tables	25,082	21,143	24,977	12,258
Average number of transcripts per school	73.8	64.1	58.2	12.9

2.6 Testing the Significance of Differences Reported in the Tables

The significance of the difference between any pair of estimates in the tables can be tested by using a t-test. To perform the test, calculate the value of t associated with the difference. This is the difference divided by the standard error of the difference. When comparing estimates across years, (which are derived from independent samples), the standard error of the difference is

$$\sqrt{SE_1^2 + SE_2^2}$$

where SE_1 is the standard error of the first estimate and SE_2 is the standard error of the second estimate. Thus, when the estimates are X_1 and X_2, the t-value is

$$t = \frac{|X_1 - X_2|}{\sqrt{SE_1^2 + SE_2^2}}$$

The difference is significant if the t-value is greater than what would be expected by chance for the appropriate number of degrees of freedom. For practical purposes, use 25 degrees of freedom for all inferences about subgroups that appear approximately uniformly in all primary sampling units (PSU) and 10 degrees of freedom for the remaining subgroups.[11]

A reasonable rule of thumb to use for the tables in this report is the following: If the analysis involves the consideration of subgroup estimates for the subgroups defined by race/ethnicity, community type, or region, use 10 degrees of freedom. Otherwise, use 25 degrees of freedom. This guidance applies to analyses both within a single year and across years. At the 0.05 probability level with 25 degrees of freedom, t must be larger than 2.060 to be significant. With 10 degrees of freedom, t must be larger than 2.228.

For example, to determine whether the mean number of graduates taking the least stringent of the Core Curriculum requirements (4 years of English, 3 years of Social Studies, 2 years of Science, and 2 years of Mathematics) changed significantly from 1990 to 1994, consult the last line in Table 11. This line shows that the percentage of graduates taking these courses changed from 66.54 percent in 1990 to 74.64 percent in 1994. The standard errors for these percentages are 2.06 and 1.57, respectively. Thus, the t-value for this difference is

$$(74.64-66.54) \div \sqrt{(1.57)^2 + (2.06)^2} = 3.127$$

Since 3.127 is greater than 2.060, the difference of 8.10 percent is significant at the 0.05 level of probability.

To determine whether a correlation reported in Tables 22 through 25 is statistically significant, multiply the standard error by 1.96. Then construct a confidence interval around the correlation by first subtracting the product from the correlation to obtain the lower bound of the interval and then adding the product to the correlation to obtain the upper bound. If zero (0) is between the lower and upper bounds, then the correlation is not significant. If the confidence interval excludes zero (0), then the correlation is significant at the 0.05 probability level.

---

[11] For a detailed discussion of the estimation of sampling variance and the determination of the degrees of freedom, see Chapter 6 of the *1994 NAEP Technical Report*, Chapter 10 of the *1990 NAEP Technical Report*, and Chapter 14 of the *1986 NAEP Technical Report*.

For example, Table 23 shows that a student's GPA has a correlation of 0.55 with his or her NAEP Reading proficiency with a standard error of 0.01. The lower bound of the confidence interval is 0.55 - (0.01 x 1.96) or 0.53. The upper bound is 0.55 + (0.01 x 1.96) or 0.57. Since zero is not between 0.53 and 0.57, the correlation is statistically significant.

To determine the practical significance of a correlation, note that the square of a correlation represents the percentage of the variance for which it accounts. Since 0.55 squared is 0.30, the GPA accounts for 30 percent of the variance in NAEP Reading proficiency scores.

When making either implicit or explicit multiple comparisons among groups (e.g., the four regions or the five ethnic groups), we recommend using the appropriate Bonferroni adjustment to p. Since there are six possible pairwise comparisons among the four Census regions, the t-value for $p \leq 0.0083$, rather than for $p \leq 0.05$, should be used (that is, $t \geq 3.2.775$). Similarly, since there are 10 possible pairwise comparisons among the 5 race/ethnic groups, tests should be made for $t \geq 3.5821$.

2.7 Comparability with Other Analyses

The data from the 1982, 1987, and 1990 studies have been reported elsewhere but have sometimes differed slightly in the values reported. The values have differed for a number of reasons:

- Use of different versions of the 1982 data file;
- Use of different taxonomies for constructed derived variables such as the number of credits earned in English or Mathematics; and
- Use of different criteria for including or excluding students in the analyses.

In this study we have attempted to use the same files, taxonomy, and inclusion/exclusion rules as the most recently published studies.

2.7.1 The High School and Beyond Data File

Two versions of the High School and Beyond First Follow-up data file are commonly available. One is available on CD-ROM from the National Center for Education Statistics and the other is maintained on an IBM mainframe at the Martin-Marietta data center on an NCES account. Each file contains a slightly different number of records for 1982 graduates.[12] Because the *Digest of Education Statistics 1995* (NCES 95-029) and *Vocational Education in the United States: The Early 1990s* (NCES 95-024) and other recent publications have used the Martin-Marietta version of the High School and Beyond file, we have based all 1982 numbers reported in this study on that file.

2.7.2 Taxonomy for Derived Variables

The *Classification of Secondary School Courses* (CSSC) contains approximately 2,200 unique codes. This is too large a number to include a row for each code in the tables. For this reason, Westat derived variables representing such categories as Mathematics, Algebra, Geometry, Calculus, and AP Calculus. While this is a relatively straightforward process, questions can arise about where to place such courses as "Algebra and Analytic Geometry" (CSSC code 270415) or "Computers in Business" (CSSC code 170311). The resolutions of these questions have been codified in a pair of reporting taxonomies.

The 1987 High School Transcript Study developed a taxonomy used for the *1987 High School Transcript Study Tabulations*. This taxonomy, which is documented in the *1987 Tabulations*, was developed with an emphasis on strictly limiting the content of "academic" categories (the categories recommended for special emphasis in *A Nation at Risk*) to academic courses. It was applied to data from the 1982 High School and Beyond First Follow-up Study and the 1987 HSTS data. Both of these data sets were coded using the CSSC. The 1990 High School Transcript Study used a slightly expanded version of the same taxonomy in its reports.[13]

---

[12] The CD-ROM contains records from 10,152 1982 graduates. The mainframe file contains records from 12,736 1982 graduates. Of these, 12, 275 were included in the tables in this report.

[13] The 1990 study added 18 new codes to the CSSC and to the taxonomy. The full taxonomy is documented in both *The 1990 High School Transcript Study Tabulations* and *The 1990 High School Transcript Study Data File User's Manual*.

The *Secondary School Taxonomy* (SST) was originally developed in the late 1980s.[14] In addition to the HS&B and 1987 HSTS files, variants of it were applied to files produced by the Educational Testing Service Study of Academic Prediction of Growth (1969) and the National Longitudinal Study-Youth Cohort (1975-1982), which were coded using unique classification schemes which were not fully compatible with the CSSC. The SST was developed under the auspices of the National Assessment of Vocational Education (NAVE) and was subject to extensive review by vocational and academic educators and researchers, NAVE staff, and contractor staff. Although there is broad agreement between the taxonomy developed for the 1987 HSTS and the SST, the SST has a less purely academic emphasis and a more richly defined group of vocational education categories.

Since most recent NCES publications which have analyzed transcript data have used the SST, we have adopted it for the tabulations in this study. The SST is, however, limited in that it contains only the CSSC codes found in the data sets which it was designed to analyze. For this reason, we have expanded the SST to include all currently defined CSSC codes.[15] The version of the Secondary School Taxonomy used in these tables also differs from the version used in previous studies in two other respects:

- We have added some additional categories. These have not changed the definition of any of the existing categories.
- We have separated Drama and Dance into two categories. This is consistent with the reporting level in the previous high school transcript studies. Since these two values are always reported adjacent to each other, they can easily be added together to determine the corresponding combined category.

Because the SST assigns courses differently to academic and vocational categories, analyses based on the SST report larger numbers of students following vocational curricula and fewer following academic curricula than the taxonomy used in the 1987 and 1990 transcript studies. For example, the 1990 HSTS classified 75 percent of 1990 graduates[16] in academic programs and 6 percent in vocational programs (1990 HSTS Tabulations, Table 1), while the current study classifies 62 percent of 1990 graduates in academic programs and 10 percent in vocational programs (Table 2).

---

[14] A description of the development of the SST is provided in Gifford, Hoachlander, and Tuma (1994), *The Secondary School Taxonomy Final Report*.

[15] In addition to the studies cited earlier in this section, the National Education Longitudinal Study (NELS) of 1988 Second Follow-Up: Transcript Component collected transcripts from high school graduates and coded them using the CSSC. The students in the transcript component of the NELS study graduated from high school in 1992. Researchers at National Opinion Research Center, which conducted the study for NCES have informed us that they were able to use the CSSC codes in the 1990 version of the CSSC and did not need to add any additional codes.

[16] Legum, Stanley; Caldwell, Nancy; Goksel, Huseyin; Haynes, Jacqueline; Hynson, Charles; Rust, Keith; Blecher, Nina. *The 1990 High School Transcript Study Tabulations: Comparative Data on Credits Earned and Demographics for 1990, 1987, and 1982 High School*

One other feature of the SST that should be kept in mind when interpreting these tables is that is classifies English as a Second Language (ESL) courses as Foreign Language rather than English courses. This has the effect of lowering the number of students who appear to satisfy the recommendation of completing 4 years of English. It also has the effect of increasing the apparent number of Foreign Language courses completed and lowering the correlations of number of years of Foreign Language completed with each set of the NAEP proficiency scores. These effects are particularly noticeable among Hispanic graduates.

2.7.3 Inclusion and Exclusion Criteria

We have adopted the following rules for including and excluding students in the analyses which produced the tables:

1. We have included both public and private school students.
2. We have excluded students with special education diplomas and certificates of attendance.
3. We have included students with disabilities (HCFLAG=2 in the HSTS studies) who received regular or honors diplomas (i.e., those who were not screened out by rule 2). This rule led to a substantial increase in the number of students included in the 1987 analysis because the 1987 HSTS oversampled students with disabilities.
4. We have excluded students with zero English credits.
5. We have excluded students with less than 16 Carnegie units.

These inclusion and exclusion rules are consistent with those used in the other recent NCES studies.

Some previous studies have excluded students with more than 32 Carnegie units on the grounds that they must have shorter class periods than normal schools and use of their data would inflate our estimates. In the current study, we did NOT exclude students with more than 32 Carnegie

---

Graduates. U.S. Department of Education, Office of Educational Research and Improvement, National Center for Education Statistics, NCES 93-423, Washington, DC, April 1993.

units. An analysis of the 4 schools in the 1994 HSTS with the highest percentage of students with more than 32 credits showed that all had class periods between 40 and 45 minutes. Three of these schools had requirements for Religion courses and particularly stringent graduation requirements. The fourth school was a continuation school with some students having credits earned in the 1960s and 1970s, as well as recent credits. The mean and maximum number of credits earned were comparable for each sample as displayed below.

Mean and Maximum Number of Credits in Four Transcript Studies

Study	Mean number of credits	Maximum number of credits
1982	23.6	75.3
1987	25.1	74.0
1990	25.9	69.4
1994	26.0	72.5

The decision to remove the upper limit on Carnegie units slightly increased both the number of students in the calculations and the various estimates reported. For example, the 1982 dataset contains 243 graduates (out of 12,413) with more than 32 credits. Including these students raised the unweighted mean number of credits earned from 23.40 (s.d. = 3.15) to 23.64 (s.d. = 3.63).

3. TABLE-SPECIFIC NOTES

In tables with columns displaying estimates by race/ethnicity, some headings have been abbreviated. The shorter and longer versions of each heading are:

Asian/Pacif = Asian/Pacific Islander

NativAmeri = American Indian/Alaska Native

Hispa = Hispanic

In tables with columns displaying estimates by student program, some headings have been abbreviated. The shorter and longer versions of each heading are:

Acad. = Academic Track

Voc. = Vocational Track

Because some of the tables subcategorize students into a large number of categories (45 in the case of the 5 race/ethnicity categories when classified by the 9 credits-earned categories), some of the cell sizes are very small. This is something evident in relatively large standard errors. When an estimate has been calculated based on five or fewer students, we have marked the value with a pound sign (#) to the right of the estimate.

Tables 8 through 102, 106 through 109, 111 through 114, and 116 through 119.

> Individual CSSC course codes have been classified, for the purpose of these tables, into subject matter groupings. The codes contained in each heading are shown in Appendix B.

Tables 11 through 21 (Core Curriculum):

4 English + 3 Social Studies + 3 Science + 3 Mathematics + 1/2 Computer + 2 Foreign Language = Students have earned the following minimum numbers of credits in each of the Core Curriculum subject areas:

4.0 credits in English courses
3.0 credits in History/Social Studies courses
3.0 credits in Science courses
3.0 credits in Mathematics courses
0.5 credits in Computer Science courses
2.0 credits in Foreign Language courses

Tables 18 through 20 (States and Graduation Requirements):

These tables compare states with particular graduation requirements (Law #1 and Law #2) with other states. The Law #1 states have graduation requirements corresponding to the minimal academic program discussed in Section 1.1 The Law #2 states require 1 less year of Science and 1 less year of Mathematics for graduation. These laws are as follows:

Law #1: 4.0 credits in English courses
3.0 credits in History/Social Studies courses
3.0 credits in Science courses
3.0 credits in Mathematics courses

Law #2: 4.0 credits in English courses
3.0 credits in History/Social Studies courses
2.0 credits in Science courses
2.0 credits in Mathematics courses

The table that follows displays graduation requirements by state in terms of Law 1 and Law 2. A "1" in the cell corresponding to a state and year indicates that the state required that students graduating in that year complete at least the Law 1 requirements. A "2" in a cell indicates that the state required that students graduating in that year complete at least the Law 2 requirements. A blank indicates that the state required fewer credits in at least one of the subjects than are required by Law 2. Note that states satisfying Law 1 *a fortiori* also satisfy Law 2. When a cell is shaded, the state had no schools represented in the corresponding transcript study.

Note: We would also like to thank Dr. Rolf Blank of the Council of Chief State School Officers for his assistance identifying which states qualified as Law 1 states and which as Law 2 states in 1987, 1990, and 1994.

* Colorado has no state-level graduation requirements. All Colorado schools in the 1990 sample required the "Law 2" pattern. There were two Colorado schools in the 1994 sample. One required the "Law 2" conditions to graduate and one did not. Students in the first of these schools were analyzed as if they lived in a Law 2 state.

BEST COPY AVAILABLE

For purposes of the analyses presented in this report, most state-level requirements were determined from the catalogs provided by each school. These were supplemented by lists of state requirements contained in Snyder and Hoffman (1995) *Digest of Education Statistics* 1995 (Table 151), Smith et al. (1995) *Condition of Education 1995* (Table 24-9), and Medrich et al. (1992) Overview and *Inventory of State Requirements for School Coursework and Attendance* (Appendix A). Blank et al., (1955) *State Education Policies on K-12 Curriculum, Student Assessment, and Teacher Certification: 1995* provides details of state graduation requirements as of the end of 1994.

Although a number of the states had special diplomas in 1994 that satisfy the Law #1 definitions, they have not been included as Law #1 states, because these requirements did not apply to all students.

Tables 22 through 25:

> Tables 22 through 25 report on the correlation among various variables collected during the transcript study and NAEP proficiencies. Each cell in the correlation tables reports three values: the Pearson correlation coefficient, the standard error of the correlation, and the number of observations upon which the correlation is based.
>
> NAEP proficiencies produced by the 1994 NAEP are in the form of five plausible values for each assessed topic. The plausible values distributed as part of the standard NAEP data files are conditioned on a large number of variables collected as part of NAEP. The conditioning process removes measurement bias from group level estimates based on relationships involving NAEP proficiencies and the conditioning variables. The effects of relationships between NAEP proficiencies and nonconditioned variables may be biased. In order to avoid this problem, we arranged to have the transcript study variables included in the conditioning process.[16]
>
> Correlations were calculated using each of the five plausible values, and standard errors were calculated for each using the jackknife procedure. The five correlations were then averaged, and the variance of this average was added to the variance of the correlation of the first plausible value with the analytic variable to obtain the variance of the correlation. The square root of this variance is the standard error displayed in the table.

---

[16] See the *1994 NAEP Technical Report* for a detailed discussion of plausible values. We would like to thank Alfred Rogers and Norma Norris of Educational Testing Service for producing the file of NAEP proficiencies that includes the transcript study variables.

Tables 27 through 31 and 40 through 102 (Percentage of Graduates Earning Indicated Minimum Credits):

The number appearing in parentheses following the course or series of courses indicates the minimum number of credits that a student must have earned in the course(s) in order to be represented in the table.

Table 103 through 120 (tables involving NAEP proficiencies):

The NAEP proficiencies produced by the 1994 NAEP are given as five plausible values for each assessed topic. The plausible values distributed as part of the standard NAEP data files are conditioned on numerous variables collected as part of NAEP. The conditioning process removes measurement bias from group level estimates based on relationships involving NAEP proficiencies and the conditioning variables. Because effects of relationships between NAEP proficiencies and non-conditioned variables may be biased, we arranged to have the transcript study variables included in the conditioning process.

The NAEP proficiencies and the associated standard errors were calculated using a jackknife procedure on each of the five plausible values and then taking the mean of the five estimates to produce the proficiency values displayed in the tables. For each data point the variance of this mean was added to the variance produced by the jackknife procedure on the first plausible value. The square root of this sum is the standard error displayed in the table.

Table 121:

Each code in the *Classification of Secondary School Courses* that occurred in the 1982, 1987, 1990, and 1994 transcript databases is presented in numerical order. A single course title is shown with each code, although the classification system itself includes more than one title for many of the codes. When a course is found on one or more 1994 transcripts, the title in the table is the primary title in the 1994 revision of the CSSC. When a course is found only among 1982 or 1987 transcripts, the title in the table is identical to that used in the corresponding 1987 table (Table 1). When a 1982 code was changed, it is reported using the 1987 code and a cross reference is given to the 1982 code. No such reassignments were made for the 1990 and 1994 studies, although 18 codes were added to the CSSC during the coding operation in 1990 and 12 were added in 1994. Only those CSSC codes which actually occur in one of the four studies appear in the table.

NOTE: Because of the definitions of the Student Program Types, it is not possible for "Voc." or "Neither" students to take the course combinations shown in the first four rows of this table. Students who took 4 years of English, 3 years of Social Studies or History, 3 years of Science, and 3 years of mathematics are, by definition, classified as "Acad" or "Both."

NOTE: The estimates in this table may differ somewhat from other NCES reports for reasons discussed in Chapter 2, such as differences in inclusion/exclusion criteria for student records or changes in the taxonomy used to summarize the courses.

	S.E.	2.26	1.65	1.78	2.35

NOTE: The 1994 Law 1 states are: Florida, Louisiana, and Pennsylvania.
The Law 2 states are: Alabama, Alaska, Arizona, Arkansas, Connecticut, Delaware, Florida, Georgia, Hawaii, Kansas, Louisiana, Maryland, New Jersey, New Hampshire, New Mexico, New York, North Dakota, Pennsylvania, South Carolina, South Dakota, Vermont, Virginia, West Virginia, and Wisconsin.
In Colorado, school districts, not the state, set graduation requirements. For this reason, if a student is in a Colorado district with law 2 requirements he or she is treated as if in a law 2 state. If a student is in a Colorado district with weaker requirements, he or she is treated as if in a non-law 2 state.

NOTE: The estimates in this table may differ somewhat from other NCES reports for reasons discussed in Chapter 2, such as differences in inclusion/exclusion criteria for student records or changes in the taxonomy used to summarize the courses.

		The Law State Categories			
New Basics		Law 1 States	Non-Law 1 States	Law 2 States	Non-Law 2 States
4 English + 3 Social Studies + 3 Science + 3 Mathematics + 1/2 Computer + 2 Foreign Language	Percent	33.45	16.44	26.50	10.85
	S.E.	2.68	1.08	1.69	0.89
4 English + 3 Social Studies + 3 Science + 3 Mathematics + 1/2 Computer	Percent	47.46	20.44	32.75	14.84
	S.E.	2.49	1.19	2.01	0.99
4 English + 3 Social Studies + 3 Science + 3 Mathematics + 2 Foreign Language	Percent	50.46	27.86	40.78	20.81
	S.E.	2.25	1.35	1.74	1.51
4 English + 3 Social Studies + 3 Science + 3 Mathematics	Percent	72.73	34.79	51.07	27.83
	S.E.	2.50	1.48	2.39	1.69
4 English + 3 Social Studies + 2 Science + 2 Mathematics	Percent	91.91	63.53	82.37	52.34
	S.E.	1.40	2.36	2.11	2.88

NOTE: The 1990 Law 1 states are: Flordia, Louisiana, and Pennsylvania. The Law 2 states are: Alabama, Alaska, Arkansas, Colorado, Connecticut, Delaware, Florida, Georgia, Hawaii, Kansas, Louisiana, Maryland, New Jersey, New Mexico, New York, North Dakota, Pennsylvania, South Carolina, South Dakota, Texas, Vermont, Virginia, West Virginia, and Wisconsin.
Although Colorado does not have state-mandated graduation requirements, all students from Colorado in the 1990 sample were from schools requiring at least the equivalent of law 2 for graduation.

NOTE: The estimates in this table may differ somewhat from other NCES reports for reasons discussed in Chapter 2, such as differences in inclusion/exclusion criteria for student records or changes in the taxonomy used to summarize the courses.

NOTE: Means and standard errors based on less than 30 observations have been set to missing (.). Furthermore, users are cautioned against performing t-tests on cells with NAEP proficiencies that have been calculated with an N smaller than 62. NAEP considers a cell size of 62 the minimum required for performing meaningful comparisons.

NOTE: Means and standard errors based on less than 30 observations have been set to missing (.). Furthermore, users are cautioned against performing t-tests on cells with NAEP proficiencies that have been calculated with an N smaller than 62. NAEP considers a cell size of 62 the minimum required for performing meaningful comparisons.

NOTE: Means and standard errors based on less than 30 observations have been set to missing (.). Furthermore, users are cautioned against performing t-tests on cells with NAEP proficiencies that have been calculated with an N smaller than 62. NAEP considers a cell size of 62 the minimum required for performing meaningful comparisons.

NOTE: Means and standard errors based on less than 30 observations have been set to missing (.). Furthermore, users are cautioned against performing t-tests on cells with NAEP proficiencies that have been calculated with an N smaller than 62. NAEP considers a cell size of 62 the minimum required for performing meaningful comparisons.

NOTE: Means and standard errors based on less than 30 observations have been set to missing (.). Furthermore, users are cautioned against performing t-tests on cells with NAEP proficiencies that have been calculated with an N smaller than 62. NAEP considers a cell size of 62 the minimum required for performing meaningful comparisons.

NOTE: Means and standard errors based on less than 30 observations have been set to missing (.). Furthermore, users are cautioned against performing t-tests on cells with NAEP proficiencies that have been calculated with an N smaller than 62. NAEP considers a cell size of 62 the minimum required for performing meaningful comparisons.

5XXXXX	Special Education Courses	303,492	10.26	262,212	9.53	207,514	7.55	21,672	0.76
6XXXXX	Uncodable	27,928	0.94	45,779	1.66	22,761	0.83	.	.

NOTE: For presentation purposes, all Special Education courses included in this table have been treated as one CSSC code, 5XXXXX.

NOTE: CSSC code 6XXXXX represents courses for which we have insufficient information to assign a regular CSSC code. For example, some transcript entries were so abbreviated that we could not determine the nature of the courses. In other cases, a transcript indicated that credit was awarded for transferred courses, but provided no list of specific courses.

Appendix B

Listings of CSSC Codes Within Subject-Area Categories

APPENDIX B. LISTINGS OF CSSC CODES WITHIN SUBJECT-AREA CATEGORIES

This appendix presents the subject field taxonomy that provides the structure for grouping the courses. The lists that follow identify the CSSC codes in each subject-area category. These categories are referred to as "stubs" because they are associated with row labels, or stubs, in the tables.

The subject area categories are organized according to the Secondary School Taxonomy (SST).[1] Exhibit B-1 displays the taxonomy. We have, however, added two categories to the second level of the SST: Computer-related Studies and Special Education. The Computer-related Studies category is part of the Academic group and has three subcategories: Clerical and Data Entry, Computer Applications, and Computer Science. Many of the computer-related courses also appear in various math and vocational categories. They are counted only once when calculating totals that include multiple categories.

The Special Education category is part of the Personal/Other Courses group and includes a large number of courses that are usually open only to students with Individualized Educational Programs (IEP). These courses can be found in stub 1500. Many of these special education courses are also included in the various subject area categories. They are, however, counted only once when calculating totals and subtotals.

In addition to adding the two new categories, we have split the category Drama/Dance into two categories: Drama and Dance. We have also made a number of minor adjustments associated with new courses or courses that did not appear in the transcripts being analyzed using previous versions of the SST. For example, we added Cell and Molecular Biology, Other (260400) to the Biology category and Desktop Publishing (480271), a course introduced in the 1994 HSTS, to the Trade and Industry Category. We have also changed the name of the category "Advanced Calculus" to "Calculus" since it contains all the CSSC codes for calculus courses.

We have also added a number of subcategories to some of the categories in the Academic group. These subcategories do not change the definition of any of the existing categories or subcategories, but provide a means for summarizing the data at a level that has proved useful in previous transcript studies. For example, because we believe they may be of special analytic interest, we have added a number of categories for remedial/below grade level courses and categories for AP courses. The new subcategories are marked with an asterisk in the exhibit.

---

[1] Gifford, A.G., Hoachlander, E.G., and Tuma, J.E., The Secondary School Taxonomy, a report prepared for the National Assessment of Vocational Education, Office of Planning, Budget, and Evaluation, U.S. Department of Education (Berkeley: MPR Associates, Inc., February, 1989).

Note that the categories are hierarchical in nature. That is, codes in a subcategory also appear in the appropriate higher-order category. For example, "AP Calculus" is included in "Calculus" and in "Mathematics." For example, the category "English" includes "Etymology" (230412) and "Vocational English" (230156), which are not included in any of the subcategories of "English."

The Hierarchical Listing that follows indicates in outline form the categories and subcategories. The Detailed Stub List, which follows the Hierarchical Listing, is presented in the same order as the Hierarchical Listing. The Detailed Stub List is an exhaustive list of every code included in each category and each subcategory. It contains all valid CSSC codes whether or not they appear in the current study. Previously used codes that have been dropped or reassigned have been included for the sake of completeness. This version of the SST can be applied to any study using the CSSC without the need to add additional codes.
